Research Summary

A low-temperature denitrification catalyst is a specialized material designed to facilitate the removal of nitrogen oxides (NO_x) from industrial emissions at lower operating temperatures, typically ranging from 150°C to 300°C. These catalysts play a critical role in selective catalytic reduction (SCR) systems, where they enable the chemical reaction between NO_x and a reducing agent, such as ammonia or urea, to produce harmless nitrogen (N₂) and water (H₂O). The low-temperature capability allows these catalysts to be used in processes where traditional high-temperature catalysts are inefficient, such as in industries with lower exhaust gas temperatures or intermittent operations. They are commonly employed in power plants, chemical manufacturing, and waste incineration facilities to meet stringent environmental regulations and reduce air pollution. These catalysts are engineered for high activity, durability, and resistance to poisoning by substances like sulfur and dust.

The major global manufacturers of Low Temperature Denitrification Catalyst include
