Research Summary

Low temperature sealing glass refers to a type of glass material that can be fused or bonded at relatively low temperatures compared to traditional glass sealing techniques. It is formulated with specific compositions and additives to lower its softening temperature, typically below 600 degrees Celsius (1112 degrees Fahrenheit). Low temperature sealing glass is commonly used for hermetic sealing applications, where two or more glass or ceramic components need to be joined together to create a gas-tight or vacuum-sealed enclosure. This type of glass is often used in industries such as electronics, automotive, and medical devices, where the sealing process needs to be performed without damaging or distorting the materials being sealed. The low temperature sealing process involves carefully heating the glass to its softening point, bringing the components together, and applying pressure or other means to create a secure and reliable seal. Low temperature sealing glass offers the advantage of enabling bonding without causing thermal stress or compromising the structural integrity of the sealed components.

The major global manufacturers of Low Temperature Sealing Glass include Nippon Electric Glass, NAMICS, Ferro, SCHOTT, Showa Denko Materials, YEK Glass, AGC, Kunming Noble Metal Electronic Materials, Shenzhen Sialom Advanced Materials, Anywhere Powder, Beijing Asahi Electronic Materials, etc. The global players competition landscape in this report is divided into three tiers.
