Research Summary

An LTE base station, also known as an eNodeB (evolved NodeB), is a critical component of the Long-Term Evolution (LTE) cellular network infrastructure. It serves as the interface between user devices and the core network. The LTE base station is responsible for transmitting and receiving data signals to and from mobile devices within a specific coverage area, known as a cell. It consists of multiple radio antennas and transceivers that facilitate wireless communication over the LTE network. The eNodeB handles tasks such as signal modulation, encoding, and decoding, as well as managing radio resources, handovers, and connections with user devices. It connects to the LTE core network, which further routes the data to its intended destinations. LTE base stations are strategically deployed to provide coverage to a large geographical area, ensuring seamless connectivity for a high number of simultaneous users. These base stations play a crucial role in delivering fast and reliable mobile data services in LTE networks.

The major global manufacturers of LTE Base Station (eNodeB) include Huawei,
