Research Summary

A lung function instrument, also known as a pulmonary function test (PFT) device, is a medical tool used to evaluate how well the lungs are working. These instruments measure various aspects of lung performance, including lung volume, capacity, rates of flow, and gas exchange. Common types of lung function instruments include spirometers, which measure the amount and speed of air that can be inhaled and exhaled, plethysmographs, which assess lung volume and airway resistance, and gas analyzers, which evaluate gas diffusion across the alveolar membrane. These devices are essential in diagnosing and managing respiratory conditions such as asthma, chronic obstructive pulmonary disease (COPD), and interstitial lung disease, aiding in the development of appropriate treatment plans and monitoring disease progression.

The major global manufacturers of Lung Function Instrument include CareFusion, Schiller, CHEST.
