Research Summary

A magnetic drive pump, also known as a magnetically coupled pump or mag-drive pump, is a type of pump that utilizes magnetic fields to transmit torque from the motor to the impeller, without the need for a traditional direct mechanical shaft connection. The pump consists of two main components: an outer drive magnet assembly connected to the motor shaft and an inner impeller assembly with a magnet. These two assemblies are separated by a containment shell, typically made of non-magnetic material. When the motor rotates the outer magnet assembly, the magnetic field passes through the containment shell and couples with the inner magnet assembly, causing the impeller to rotate and generate fluid flow. The main advantage of magnetic drive pumps is their hermetically sealed design, as the containment shell prevents any leakage of the pumped fluid. This makes them ideal for handling corrosive, toxic, or hazardous liquids, as well as for applications requiring leak-free operation. Magnetic drive pumps are commonly used in industries such as chemical processing, pharmaceuticals, cooling systems, and wastewater treatment, where reliability, safety, and containment of fluids are crucial considerations.

The major global manufacturers of Magnetic Drive Pumps include Flowserve, Sundyne, Iwaki, Hermetic, Dickow Pumpen, Sanwa Hydrotech, Klaus Union, Dandong Colossus, ITT Goulds Pumps, Richter Chemie-Technik, Verder Liquids, Magnatex Pumps, Lanzhou Highland, ASSOMA, Taicang Magnetic Pump, March Manufacturing, GemmeCotti, Desmi, etc. The global players competition landscape in this report is divided into three tiers.
