Research Summary

A magnetic float level switch is a device used to monitor and control liquid levels in tanks or other vessels. It consists of a buoyant float, which contains a magnet, and a stationary switch assembly containing reed switches or other magnetically operated switches. The float is designed to rise or fall with the liquid level, and as it moves, the magnet inside the float triggers the reed switches in the switch assembly. This change in magnetic field causes the switches to open or close, indicating the presence or absence of the liquid at a specific level. The position of the float determines the state of the switch, allowing for the detection of high or low liquid levels. Magnetic float level switches are commonly used in various industries, such as oil and gas, chemical processing, water treatment, and storage facilities, to provide reliable and accurate level sensing for process control, overflow protection, and pump control applications. They are known for their simplicity, durability, and suitability for a wide range of liquids, including corrosive and hazardous materials.
