Research Summary

Magnetic particles, also known as magnetic powder, are tiny particles that possess magnetic properties. These particles are typically comprised of a magnetic material, such as iron or iron oxide, and are often used in various applications involving testing, inspection, or separation processes. Magnetic particle inspection (MPI) is a widely used non-destructive testing method that relies on the magnetic properties of these particles. In MPI, a magnetic field is applied to the object being tested, and the magnetic particles are applied to its surface. If there is a defect or crack in the material, the magnetic particles will gather or "pool" at the site, forming visible indications. This allows inspectors to identify and evaluate potential flaws in ferromagnetic materials. Magnetic particles are also utilized in magnetic separation processes, where they can be selectively attracted or repelled by a magnetic field to separate and purify materials. Magnetic particles play a crucial role in various industrial applications, particularly in testing, inspection, and separation processes involving magnetic materials.

The major global manufacturers of Magnetic Particle include MQI, Aichi Steel, Zhao Ri

Ke, Galaxy Magnets, Yuhong, Huiling, Western Magnet, San Huan, Hoosier Magnetics, Todakogyo, HIMAG, DMEGC Magnetics, Zhejiang Ante, BGRIMM Magnetic, Maanshan CY, Shunde Baling, MGC, Comc Technology, etc. The global players competition landscape in this report is divided into three tiers.
