Research Summary

Magnetic turbomolecular pumps are a type of vacuum pump used in high-vacuum applications to remove gas molecules from a chamber or system. Unlike traditional turbomolecular pumps, which use mechanical bearings to support the rotating turbine blades, magnetic turbomolecular pumps utilize magnetic bearings to levitate and spin the rotor without physical contact. This design eliminates the need for lubrication and reduces friction, resulting in lower vibration levels, longer service life, and higher reliability. Magnetic turbomolecular pumps can achieve high pumping speeds and achieve ultra-high vacuum levels, making them suitable for use in semiconductor manufacturing, analytical instrumentation, particle accelerators, and other demanding vacuum processes. Additionally, their compact size and efficient operation make them ideal for integration into vacuum systems where space and energy efficiency are crucial.

The major global manufacturers of Magnetic Turbomolecular Pumps include Pfeiffer Vacuum, Atlas (Edwards & Leybold), Osaka Vacuum, Shimadzu, Agilent, Ulvac, KYKY, Multi-micro Technology, Emaging, Ebara, etc. The global players competition landscape
