### Research Summary

Maleic anhydride graft polymer is a chemically modified polymer that incorporates maleic anhydride groups into its molecular structure. This grafting process introduces reactive sites that significantly enhance the polymer's adhesion, compatibility, and reactivity. These improved properties make maleic anhydride graft polymers valuable as compatibilizers and coupling agents in polymer blends and composites, facilitating better interaction between different materials. They are widely used in various industries, including automotive, packaging, and construction, where they enhance the bonding between polymers and fillers or reinforcements, leading to stronger, more durable products. Additionally, these polymers are utilized in adhesives, coatings, and impact modifiers, where their enhanced mechanical properties and stability are crucial for performance.
