Research Summary

Maleic anhydride-grafted polypropylene (MA-g-PP) refers to a modified form of polypropylene where maleic anhydride groups have been chemically attached to the polypropylene polymer chains. This modification process is achieved through a grafting reaction, where maleic anhydride monomers react with the polypropylene backbone, resulting in the incorporation of maleic anhydride functional groups within the polymer structure. The grafting of maleic anhydride onto polypropylene enhances the material's compatibility with polar substances and improves its adhesion properties. This modified polypropylene is commonly utilized as a coupling agent in polymer blends, acting as a bridge between different polymers and improving their overall compatibility and strength. MA-g-PP finds applications in industries such as automotive, packaging, textiles, and adhesives, where its enhanced adhesive properties and improved performance in polar environments are desirable. It offers a versatile solution for achieving enhanced material properties and expanding the range of applications for polypropylene-based materials.

The major global manufacturers of Maleic Anhydride-grafted Polypropylene include Eastman, SI Group, Clariant, SK Functional Polymer, ExxonMobil, Westlake Chemical, Dow, Guangzhou Lushan New Materials, Huangshan Banner Technology, Fine Blend, Ningbo Materchem, etc. The global players competition landscape in this report is divided into three tiers.
