Research Summary

A manual flush valve, also known as a manual flushometer, is a mechanical device used in commercial restrooms and public facilities to control the flushing of toilets or urinals. Unlike traditional gravity flush systems found in residential settings, manual flush valves are operated manually by the user. They typically consist of a lever or push button located on top of the valve, which, when pressed or pushed, initiates the flushing process by releasing a predetermined volume of water into the fixture. Manual flush valves are designed to provide efficient flushing while conserving water, as the user has control over the duration and intensity of the flush. They are commonly used in high-traffic areas where durability, reliability, and water conservation are important considerations. Manual flush valves are available in various designs and configurations to accommodate different plumbing fixtures and user preferences, ensuring effective and hygienic waste removal in commercial restroom facilities.
