Research Summary

Manual patch clamp is a laboratory technique used in electrophysiology to study the electrical properties of individual cells, particularly in neurons. The patch clamp technique involves the use of a glass pipette, which is carefully positioned and pressed against the cell membrane to create a tight seal. This seal allows researchers to measure and control the flow of ions across the membrane, providing valuable insights into ion channel activity, membrane potential, and cellular excitability. The manual aspect of patch clamp refers to the precise manipulation of the pipette by the researcher to establish and maintain the seal with the cell. This technique requires considerable skill and expertise as it demands delicate and accurate movements. Despite the advent of automated patch clamp systems, manual patch clamp remains a widely used and essential method for studying the fundamental properties of cells and their electrical signaling mechanisms.

The major global manufacturers of Manual Patch Clamp include Thorlabs, Axon Instruments (Molecular Devices), HEKA Elektronik GmbH (Harvard Bioscience), Sutter
