Research Summary

A marine electronic navigation system, also known as marine navigation equipment or marine electronics, refers to a collection of electronic devices and systems used for navigating and piloting a ship or boat at sea. These systems are designed to assist mariners in determining their position, planning routes, avoiding hazards, and safely navigating through various waterways. Marine electronic navigation systems encompass a range of equipment, including GPS (Global Positioning System), chart plotters, radar systems, depth sounders, Automatic Identification Systems (AIS), electronic compasses, electronic charts, and more. These devices provide real-time information about the vessel's position, speed, direction, surrounding vessels, water depths, navigational hazards, and other crucial data to help mariners make informed decisions while at sea. They utilize satellite signals, radio frequency transmissions, and sensors to gather and display navigation data, allowing mariners to accurately navigate, avoid collisions, and ensure safe passage. Marine electronic navigation systems have greatly enhanced the safety and efficiency of marine navigation, providing mariners with

vital information and tools to navigate confidently in both coastal and open water environments.
