Research Summary

A marine fender system is a critical component used in maritime engineering to protect vessels, docks, and other structures from damage during berthing and mooring operations. These systems are designed to absorb kinetic energy and prevent impact forces that occur when ships or boats come into contact with wharves, piers, or other vessels. Marine fender systems typically consist of fender units made from durable materials such as rubber, foam, or plastic, which are mounted on the sides of docks or ships. They absorb and dissipate the energy generated during berthing or docking maneuvers, reducing the risk of structural damage to both the vessel and the infrastructure. Marine fender systems come in various types, including cylindrical fenders, cone fenders, and pneumatic fenders, each designed to accommodate different berthing conditions, vessel sizes, and environmental factors. Their primary function is to ensure safe and efficient maritime operations by protecting assets and maintaining the integrity of port facilities and vessels.

The major global suppliers of Marine Fender System include Trelleborg, Bridgestone, Sumitomo Rubber, Maritime International, Yokohama, Hutchinson, IRM, Longwood,
