### Research Summary

A marine fire damper is a specialized safety device used in maritime applications to prevent the spread of fire through ventilation ducts and openings on a ship or marine vessel. It is designed to automatically close when exposed to high temperatures or in the event of a fire, effectively sealing off the ventilation system and containing the flames and smoke within a specific compartment. The marine fire damper is typically installed in ventilation ducts, air handling units, and fire-rated bulkheads, and it operates based on thermal triggers or a signal from a fire detection system. When activated, the damper's blades or louvers close, forming a barrier that inhibits the flow of air and fire through the ducts. This helps to limit the spread of fire, protect the ship's occupants and property, and aid in fire suppression and containment efforts. In addition to their fire-resistant properties, marine fire dampers are often tested and certified to meet specific international safety standards, such as those set by the International Maritime Organization (IMO) and classification societies.

The major global manufacturers of Marine Fire Damper include Swegon (Actionair),
