Research Summary

A marine scrubber, also known as an exhaust gas cleaning system or EGCS (Exhaust Gas Cleaning System), is a technology used in the maritime industry to reduce the emissions of sulfur oxides (SOx) and other pollutants from the exhaust gases of ships. It is primarily implemented to comply with environmental regulations, such as the International Maritime Organization's (IMO) MARPOL Annex VI, which sets limits on the sulfur content in marine fuel. A marine scrubber works by removing pollutants from the ship's exhaust gases before they are released into the atmosphere. The system typically uses a combination of water and alkaline substances, such as seawater or specialized scrubbing solutions, to wash the exhaust gases and neutralize the sulfur oxides. This process can either be carried out in an open-loop system, where seawater is used and discharged back into the ocean after treatment, or in a closed-loop system, where the scrubbing solution is contained and later treated on land. By using marine scrubbers, ships can significantly reduce their sulfur emissions, ensuring compliance with regulations and helping to mitigate the environmental impact of maritime transportation.

The major global manufacturers of Marine Scrubber include Wartsila, Alfa Laval, Yara Marine Technologies, Panasia, HHI Scrubbers, CR Ocean Engineering, Puyier, EcoSpray, Bilfinger, Valmet, Clean Marine, ME Production, Shanghai Bluesoul, Saacke, Langh Tech, AEC Maritime, PureteQ, etc. The global players competition landscape in this report is divided into three tiers.
