### Research Summary

A maskless lithography system is an advanced technology used in semiconductor manufacturing and other industries to create precise patterns and features on substrates without the need for physical masks. Unlike traditional lithography methods that utilize photomasks to transfer patterns onto wafers, a maskless lithography system employs direct writing techniques. It uses a focused electron beam or laser to directly write the desired pattern onto the substrate with high precision. The system typically includes sophisticated software and control mechanisms to accurately control the beam or laser, allowing for precise pattern customization and rapid prototyping. Maskless lithography offers advantages such as increased flexibility, reduced lead time, and enhanced pattern complexity compared to traditional mask-based lithography. It enables faster iteration cycles and the production of unique or low-volume designs without the need for expensive mask fabrication.

The major global manufacturers of Maskless Lithography System include Raith(4Pico), JEOL, Heidelberg Instruments, Vistec, Elionix, Nanoscribe, Visitech, EV Group,
