Research Summary

Material Jetting (MJ) is an additive manufacturing technique that involves the deposition of liquid photopolymer materials onto a build platform using inkjet-like printheads. In this process, the material is jetted onto the platform in precise layers, and each layer is cured or solidified using ultraviolet (UV) light. The print head selectively deposits the material according to the digital design data, allowing for the creation of complex shapes and intricate details. Material Jetting offers high resolution and accuracy, making it suitable for applications that require fine details and smooth surface finishes. It also allows for the use of multiple materials or multi-material printing, enabling the fabrication of objects with gradient properties or combinations of different materials. Material Jetting is widely used in fields such as product design, prototyping, and in some cases, small-scale production of customized or highly specialized parts.

The major global manufacturers of Material Jetting (MJ) include Stratasys, 3D Systems, Keyence, HP, Vader Systems, Xjet, etc. The global players competition landscape in this report is divided into three tiers. The first tier comprises global leading enterprises
