Research Summary

MDI (Methylene Diphenyl Diisocyanate) prepolymers are intermediate products used in the production of polyurethane materials. Prepolymers are created by reacting MDI with a polyol, such as polyester or polyether, in controlled conditions. MDI isocyanate groups react with the hydroxyl groups of the polyol, forming a chain of linkages known as urethane bonds. The resulting MDI prepolymers have a range of molecular weights and viscosities, depending on the ratio of MDI to polyol used during the synthesis. These prepolymers serve as key components in the production of various polyurethane products, including foams, coatings, adhesives, and elastomers. MDI prepolymers offer excellent mechanical properties, chemical resistance, and thermal stability, making them valuable for applications requiring durable and versatile materials. They are typically stored and handled in a controlled environment to ensure shelf stability and prevent premature curing or degradation. During the final production stage, MDI prepolymers can be further reacted with chain extenders, crosslinkers, or other additives to achieve the desired performance characteristics of the end product.

The major global manufacturers of MDI Prepolymers include Wanhua Chemical, Huntsman, BASF, Covestro, DOW, Tosoh, LANXESS, Coim Group, Isothane, SAPICI, Diafor Company, Epadur, Shandong INOV Polyurethane, Makro Chemical, Chemline, Kobe Polyurethane, etc. The global players competition landscape in this report is divided into three tiers.
