### Research Summary

Mechanical chest compression devices are medical devices designed to provide automated compressions to the chest during cardiopulmonary resuscitation (CPR). These devices are used when manual chest compressions may be challenging to perform consistently or when prolonged resuscitation efforts are required. They consist of a mechanical mechanism or system that applies compression force to the sternum in a rhythmic manner, mimicking the action of manual chest compressions. Some devices use a piston or plunger mechanism, while others utilize a load-distributing band assembly. The goal of these devices is to maintain consistent and effective chest compressions, delivering adequate blood flow to vital organs during cardiac arrest. Mechanical chest compression devices are especially valuable in situations where consistent chest compressions for an extended period are necessary, and they can be used alongside other standard resuscitation techniques. They are typically used by trained healthcare professionals, and their use can improve the quality and efficiency of CPR procedures, potentially increasing a patient's chances of survival.

The major global manufacturers of Mechanical Chest Compression Devices include Stryker (Lucas), ZOLL Medical Corporation, Michigan Instruments, Defibtech, Corpuls, Henan Maisong Medical, SunLife Science, Landswick Medical, Puray Instruments, SCHILLER, Ambul, Resuscitation International, Bangvo, AAT Alber Antriebstechnik GmbH, etc. The global players competition landscape in this report is divided into three tiers.
