Research Summary

Mechanical fire dampers are safety devices installed within heating, ventilation, and air conditioning (HVAC) systems to prevent the spread of fire and smoke through ductwork in buildings. These dampers are designed to automatically close in the event of a fire, thereby blocking the passage of flames, hot gases, and smoke from one area of a building to another. Mechanical fire dampers typically consist of a blade or curtain held open by a fusible link or thermal sensor. When exposed to high temperatures, the fusible link or thermal sensor triggers the closure of the damper, either by gravity or spring action, effectively sealing off the duct. This helps contain the fire and smoke within the compartment of origin, allowing occupants to safely evacuate and preventing further spread of the fire to other areas of the building. Mechanical fire dampers play a crucial role in fire protection systems, ensuring the safety of occupants and minimizing property damage during fire emergencies.

The major global manufacturers of Mechanical Fire Dampers include TROX, Johnson Controls (Ruskin), FlaktGroup, Greenheck, Swegon (Actionair), Halton, Rf-
