Research Summary

A mechanical valve needleless infusion connector is a medical device designed to provide a safe and efficient way to administer intravenous (IV) fluids or medications without the need for a needle. It typically features a valve mechanism that opens to allow the flow of fluids when connected to an IV line, but remains closed when not in use, reducing the risk of contamination and needle-stick injuries. These connectors are commonly used in healthcare settings for administering infusions, blood draws, or other treatments, and they allow for easy and secure connections between the patient's IV line and infusion sets. Needleless connectors are considered more hygienic and safer than traditional needle-based systems, making them a preferred choice in modern intravenous therapy.
