Research Summary

A medical air disinfection unit is a device used to eliminate airborne pathogens and contaminants in healthcare settings to prevent the spread of infections. These units typically utilize technologies such as ultraviolet (UV) light, high-efficiency particulate air (HEPA) filtration, or a combination of both to effectively disinfect the air. UV-C light is particularly effective at inactivating microorganisms by damaging their DNA or RNA, thereby preventing them from reproducing. HEPA filters capture and remove particles, including bacteria, viruses, and other airborne contaminants, from the air. Medical air disinfection units are commonly used in hospitals, clinics, laboratories, and other healthcare facilities to maintain clean and safe indoor air quality, reducing the risk of healthcare-associated infections (HAIs) and protecting patients, healthcare workers, and visitors. These units are often installed in patient rooms, operating theaters, waiting areas, and other critical areas where infection control is crucial.
