Research Summary

A medical cyclotron is a type of particle accelerator used in nuclear medicine to produce radioisotopes for medical imaging and diagnostics. It operates by accelerating charged particles, typically protons or deuterons, in a circular path using powerful magnetic fields. As the particles gain energy, they collide with a target material, usually a solid metal, resulting in nuclear reactions that produce radioisotopes. These radioisotopes are then extracted and further processed to create radiopharmaceuticals used in various imaging techniques, such as positron emission tomography (PET). Medical cyclotrons are capable of producing short-lived isotopes with half-lives ranging from a few minutes to a few hours, which are ideal for medical imaging applications. Safety measures are implemented to ensure radiation shielding and minimize radiation exposure to the operators and surrounding environment. Medical cyclotrons play a crucial role in providing clinicians with the necessary radioisotopes for accurate diagnosis and monitoring of various diseases and conditions.

The major global manufacturers of Medical Cyclotron include IBA, GE, Siemens,

Sumitomo, ACSI, Best Medical, etc. The global players competition landscape in this report is divided into three tiers.
