Research Summary

Medical device sterilization refers to the process of eliminating or destroying microorganisms, including bacteria, viruses, and fungi, from medical devices to ensure they are safe for use in healthcare settings. Sterilization is a critical step in the manufacturing process to achieve and maintain the desired level of cleanliness and sterility for medical devices. There are various sterilization methods available, such as steam sterilization (autoclaving), ethylene oxide (EO) sterilization, hydrogen peroxide gas plasma sterilization, gamma irradiation, and electron beam sterilization. The choice of sterilization method depends on the device's material composition, design, and intended use. Sterilization processes must be validated, closely monitored, and comply with regulatory standards to ensure the elimination of viable microorganisms while preserving the device's functionality and integrity. Properly sterilized medical devices minimize the risk of infection, enhance patient safety, and contribute to the overall efficacy of healthcare interventions.
