Research Summary

A medical heart annuloplasty ring is a device used in cardiac surgery to repair heart valve dysfunction, specifically in cases of valve regurgitation or insufficiency. The ring is typically implanted around the base of a heart valve to restore its proper shape and function, improving the valve's ability to open and close effectively. It is most commonly used in the repair of the mitral or tricuspid valve, where the valve annulus (the ring-like structure around the valve) has become dilated or distorted. The annuloplasty ring helps to reshape and reinforce the annulus, preventing further valve leakage and improving blood flow. These rings are made from biocompatible materials such as stainless steel, fabric, or synthetic polymers, and they come in a variety of shapes and sizes to fit the specific needs of the patient. By restoring proper valve function, annuloplasty rings contribute to better heart performance, reduce symptoms, and improve long-term outcomes for patients with valve-related heart conditions.
