Research Summary

Medical plastics extrusion is a manufacturing process used to produce medical components and devices by shaping plastic materials into specific forms through an extrusion machine. During the extrusion process, a plastic resin is melted and conveyed through a heated barrel using a screw mechanism. The molten plastic is then forced through a specially designed die, which shapes the plastic into a continuous profile of the desired size and shape. This profile can be a tube, a flexible or rigid profile, or a custom shape required for medical applications. Medical plastics extrusion is commonly used to manufacture various medical products, including catheters, tubing, IV sets, surgical sutures, and other medical devices. The process allows for precise control over dimensions, material properties, and surface finishes, ensuring consistency and meeting the stringent requirements of the medical industry. Medical plastics extrusion enables the production of high-quality, biocompatible, and customizable components that are essential for medical applications.

The major global manufacturers of Medical Plastics Extrusion include Vesta, Vention
