Research Summary

Medical surgical films, also known as surgical drapes or surgical covers, are sterile, protective sheets or films designed to create a barrier between the surgical field and the surrounding environment during surgical procedures. These films are made from lightweight, moisture-resistant materials such as polyethylene, polypropylene, or a combination of materials that provide a high level of protection against transmission of microorganisms and fluids. Medical surgical films are typically used to cover the patient's body, surgical instruments, and surrounding surfaces to maintain aseptic conditions, minimize the risk of infection, and promote a clean and sterile surgical field. They are available in various sizes and shapes to suit different surgical specialties and procedures. Surgical films often feature adhesive or fenestration (pre-cut openings) to allow access to the specific surgical site while maintaining a sterile environment. By providing a physical barrier, medical surgical films contribute to patient safety and infection control protocols in the operating room, helping to reduce the risk of surgical site infections and maintain the integrity of the sterile field.
