Research Summary

A medical X-ray flat panel detector (FPD) is an advanced imaging device used in digital radiography systems to capture X-ray images with improved speed and efficiency compared to traditional X-ray film. FPDs serve as the primary image receptor in digital X-ray systems, replacing the need for X-ray film and film cassettes. These detectors consist of a flat panel composed of layers that convert X-ray photons into electrical signals. Typically, there are two types of FPDs: indirect and direct conversion detectors. Indirect conversion detectors use scintillators to convert X-ray energy into visible light, which is then detected by an array of photodiodes or amorphous silicon sensors. Direct conversion detectors directly convert X-ray energy into electrical charges using materials like amorphous selenium or cadmium telluride. The electrical charges are then read out by a thin-film transistor (TFT) array and processed to generate a digital image. Medical X-ray FPDs offer several advantages over traditional film-based systems, including real-time imaging, immediate image availability, wider dynamic range, dose reduction potential, and the ability to apply image enhancements and post-processing techniques. They enhance diagnostic capabilities, improve workflow efficiency, and

enable seamless integration with picture archiving and communication systems (PACS) for digital storage, retrieval, and sharing of X-ray images.

The major global manufacturers of Medical X-ray Flat Panel Detector include Varex Imaging, Canon, Trixell, Analogic, Konica Minolta, Toshiba, Teledyne DALSA, Fujifilm, Vieworks, Iray Technology, CareRay Medical Systems, Carestream Health, Rayence, Drtech, etc. The global players competition landscape in this report is divided into three tiers.
