### Research Summary

Medium Chain Triglyceride (MCT) oil is a type of dietary fat that contains medium-length fatty acid chains. MCT oil is derived from natural sources, such as coconut and palm kernel oil, and it is composed primarily of caprylic acid (C8) and capric acid (C10). Unlike most dietary fats, which consist of long-chain triglycerides (LCTs), MCTs are metabolized differently in the body. Due to their shorter chain length, MCTs are rapidly broken down and absorbed by the liver, providing a quick source of energy. MCT oil has gained popularity as a health supplement and cooking ingredient due to its potential benefits, including improved cognitive function, increased energy levels, and potential weight loss support. It is often used as a dietary supplement, added to beverages, smoothies, or salad dressings, and it is also a common ingredient in ketogenic diets due to its ability to be converted into ketones, which are used as an alternative fuel source by the body.
