Research Summary

Melamine faced chipboard (MFC) is a type of engineered wood product commonly used in furniture and interior design. It consists of wood chips or particles bonded together with a synthetic resin, typically urea-formaldehyde, under heat and pressure to form a rigid board. The surface of the chipboard is then coated with a layer of melamine resin, which is a durable thermosetting plastic. This melamine layer can have various decorative finishes, such as wood grain, solid colors, or patterns, applied during the manufacturing process. MFC offers several advantages, including affordability, durability, and ease of maintenance. It is commonly used for furniture construction, shelving, cabinetry, and interior fittings in residential, commercial, and institutional settings due to its versatility and cost-effectiveness.
