Research Summary

A Membrane Bioreactor (MBR) is a technological system that combines biological wastewater treatment processes with membrane filtration. It is employed for the purification of water and the removal of organic matter, suspended solids, and microorganisms from wastewater streams. The MBR system utilizes a combination of an activated sludge process and a membrane filtration process. The activated sludge process involves the use of microorganisms to break down and digest organic pollutants in the wastewater. The treated water from the activated sludge process is then passed through a membrane filtration system, where microfiltration or ultrafiltration membranes are employed to separate suspended solids, bacteria, and other pollutants from the water. The membranes used in an MBR have smaller pore sizes than conventional wastewater treatment methods, resulting in higher-quality effluent that can be reused for various purposes or safely discharged into the environment. MBRs offer advantages like a smaller footprint, greater treatment efficiency, excellent solids retention, and a reduced need for additional clarifiers or settling tanks. They are commonly used in municipal and industrial wastewater treatment applications where stringent water quality

requirements must be met efficiently.

The major global manufacturers of Membrane Bioreactor (MBR) include SUEZ Water Technologies & Solutions, Toray, Asahi Kasei Chemicals, Koch Membrane System, Kubota, Mitsubishi Rayon, Evoqua, Pall, Triqua International, ADI Systems, Alfa Laval, Aquabrane, Smith & Loveless, Groupe Novasep, Beijing Origin water Technology, Tianjin Motimo, Litree, etc. The global players competition landscape in this report is divided into three tiers.
