Research Summary

Memristors, short for “memory resistors,” are electronic components with a unique property that enables them to remember the previous flow of electrical charge through them. They were theorized and later discovered in 2008 as the fourth fundamental passive circuit element, alongside resistors, capacitors, and inductors. Memristors exhibit a resistance that can be controlled and modified by the amount of charge that has passed through them in the past. This property allows memristors to retain information even when the power is turned off, similar to non-volatile memory. Memristors have applications in various fields, such as computer memory, artificial neural networks, logic circuits, and brain-inspired computing. They offer the potential for denser, faster, and more energy-efficient memory and computing technologies, making them a subject of significant research and development in the field of electronics.

The major global manufacturers of Memristors include Crossbar Inc, Fujitsu, Renesas, Innostar, Beijing InnoMem Technologis, etc. The global players competition landscape in this report is divided into three tiers. The first tier comprises global leading enterprises

that command a substantial market share, hold a dominant industry position, possess strong competitiveness and influence, and generate significant revenue. The second tier includes companies with a notable market presence and reputation; these firms actively follow industry leaders in product, service, or technological innovation and maintain a moderate revenue scale.
