Research Summary

A MEMS hydrophone is a miniaturized underwater acoustic sensor that utilizes Micro-Electro-Mechanical Systems (MEMS) technology to detect and measure sound waves in aquatic environments. These hydrophones are designed to be highly sensitive and capable of capturing a wide range of frequencies, making them suitable for various applications, including underwater communication, marine biology research, environmental monitoring, and seismic surveying. MEMS hydrophones typically consist of a diaphragm that vibrates in response to sound waves, converting acoustic energy into electrical signals. Their compact size, low power consumption, and ability to integrate with other sensors and electronic systems make MEMS hydrophones advantageous for both portable and fixed installations. Additionally, advancements in MEMS technology have led to improved performance, reliability, and cost-effectiveness, positioning these devices as essential tools in marine acoustics and underwater exploration.
