Research Summary

MEMS scanning mirrors are micro-electromechanical systems (MEMS) devices that utilize microscopic mirrors to steer or deflect laser beams or other optical signals. These mirrors are typically fabricated on a silicon substrate using semiconductor manufacturing techniques, allowing for precise control and miniaturization of the mirror's movements. MEMS scanning mirrors can be actuated using various mechanisms, such as electrostatic, electromagnetic, or piezoelectric actuators, which cause the mirror to tilt or rotate in a controlled manner. These mirrors find applications in various fields, including laser scanning systems for display projection, barcode scanning, 3D sensing, LiDAR (Light Detection and Ranging) for autonomous vehicles, optical coherence tomography (OCT) for medical imaging, and fiber-optic communication systems. MEMS scanning mirrors offer advantages such as high-speed operation, compact size, low power consumption, and high reliability, making them ideal for integration into portable and high-performance optical systems.

The major global manufacturers of MEMS Scanning Mirrors include Hamamatsu
