Research Summary

Mercury removal adsorbents are specialized materials used to capture and remove mercury contaminants from various gas or liquid streams. These adsorbents are designed to efficiently bind and immobilize mercury species, allowing for their separation from the desired medium. Different types of adsorbents are employed depending on the specific application and mercury concentration. Commonly used materials include activated carbon, zeolites, sulfur-impregnated activated carbon, and various metal oxide-based sorbents. Mercury removal adsorbents work through processes such as adsorption, chemisorption, or a combination of both, where mercury ions or elemental mercury are attracted to the active sites on the surface of the adsorbent. This enables the removal of mercury from flue gases in coal-fired power plants, natural gas purification, wastewater treatment, and industrial processes that produce mercury-contaminated effluents. The availability of effective and reliable mercury removal adsorbents plays a significant role in reducing mercury emissions and mitigating the environmental and health risks associated with mercury contamination.

The major global manufacturers of Mercury Removal Adsorbents include Calgon Carbon Corporation, UOP (Honeywell), Johnson Matthey, Cabot Corp, Pall Corporation, Nucon, Axens, Schlumberger, Basf, Beijing Sanju, Nanjing Linda, Nanjing Zhenggao, etc. The global players competition landscape in this report is divided into three tiers.
