Research Summary

Mesocarbon microbeads (MCMBs) are a form of carbon material with a unique structure and properties. They are synthesized through the carbonization of coal tar pitch, resulting in spherical particles composed of fused carbon layers. MCMBs have a high carbon content and exhibit excellent thermal stability, making them suitable for a range of applications. They are commonly used as an anode material in lithium-ion batteries due to their high capacity, low irreversible capacity loss, and good cycling stability. MCMBs have also found utility in other areas, such as catalyst supports, electrode materials for supercapacitors, and adsorption agents for gas separation. The controlled synthesis and modification of MCMBs allow for tailoring their properties to specific applications, making them an important material in various industries.

The major global manufacturers of Mesocarbon Microbeads include Nippon Carbon Co, BTR New Material Group, Shanshan Group, JFE Chemical, China Steel Chemical, Baotailong New Materials, Long Time Technology, etc. The global players competition landscape in this report is divided into three tiers.
