Research Summary

Mesoporous silica refers to a type of silica material that possesses a unique porous structure with ordered and interconnected pores on a nanometer scale. These materials are typically synthesized through a templating process where surfactant molecules are used as templates to guide the formation of the porous structure during the synthesis of silica. The resulting mesoporous silica materials have a high surface area and a well-defined pore size distribution, which can be tailored by adjusting the synthesis parameters. The mesopores, typically ranging from 2 to 50 nanometers in diameter, offer a large internal surface area, enabling enhanced adsorption and storage capacities. Mesoporous silica finds wide-ranging applications in areas such as drug delivery systems, catalyst supports, adsorbents for gas separation, and as fillers or reinforcements in composites. Due to their tunable pore structure and high surface area, mesoporous silica materials have attracted significant research interest in various fields where controlled pore size and surface functionality are desired.

The major global manufacturers of Mesoporous Silica include Taiyo Kagaku, Merck,

W.R.Grace, Mknano, So-Fe Biomedicine, XFNANO Materials, Nanocomposix, etc. The global players competition landscape in this report is divided into three tiers.
