Research Summary

A metal biliary stent is a medical device used to treat obstructions or strictures within the biliary system, which consists of the bile ducts that carry bile from the liver to the small intestine. These stents are typically made of a biocompatible metal, such as stainless steel or nitinol, and are designed to provide support and maintain patency (openness) of the bile ducts. When there is a blockage or narrowing in the bile ducts, usually caused by conditions like gallstones, tumors, or strictures, a metal biliary stent can be inserted through minimally invasive procedures, such as endoscopic retrograde cholangiopancreatography (ERCP) or percutaneous transhepatic cholangiography (PTC). The stent acts as a scaffold to keep the obstructed or narrowed area open, allowing bile to flow freely. Metal biliary stents are known for their durability, ability to resist migration, and long-term effectiveness. They can be either covered or uncovered, with covered stents featuring a synthetic material that prevents tumor ingrowth or tissue overgrowth, reducing the risk of reobstruction. The choice of stent depends on the specific clinical scenario, patient factors, and physician preference. Metal biliary stents have significantly improved the management of biliary obstructions, providing relief for patients and allowing for better overall biliary system function.

The major global manufacturers of Metal Biliary Stent include Boston Scientific, Cook Medical, Olympus, WL Gore and Associates, Cantel, Micro-Tech, Changzhou Zhiye, etc. The global players competition landscape in this report is divided into three tiers.
