### Research Summary

A metal drier, also known as a drying agent or drying catalyst, is a type of chemical compound commonly used in coatings, paints, and varnishes to accelerate the drying or curing process. Metal driers typically contain metal ions, such as cobalt, manganese, zinc, or calcium, which act as catalysts to promote the oxidation and polymerization reactions involved in the drying process. These metal ions help facilitate the cross-linking of the binding agents in the coating, resulting in a faster and more efficient drying time. Metal driers are added in small quantities to the paint or coating formulation and help enhance the film formation, improve hardness, and increase the durability of the finished product. The choice of metal drier depends on the specific coating system, desired drying speed, and the compatibility with other additives. However, it is important to use metal driers in the appropriate amounts as excessive use can lead to negative effects, such as color changes, poor adhesion, or reduced film clarity.

The major global manufacturers of Metal Drier include VECTRA, Umicore, Dow, Ege Kimya, DIC Corp, Aryavart Chemicals, Comar Chemicals, Troy Corporation, Toei Chemical, Shepherd Chemical, Pondy Oxides & Chemicals, Shenyang Zhangming,
