Research Summary

A metal insulated facing sandwich panel is a type of construction material composed of three layers: two outer metal facings and an inner core of insulation material. The metal facings, typically made of steel or aluminum, provide structural strength and durability, while the insulation core, often made of materials like polyurethane foam, polystyrene, or mineral wool, offers excellent thermal and acoustic insulation properties. These panels are designed to be lightweight yet strong, providing an efficient solution for constructing walls, roofs, and facades in industrial, commercial, and residential buildings. The sandwich panel's layered structure ensures high thermal efficiency, fire resistance, and quick installation, making it a popular choice for building envelopes where energy efficiency and speed of construction are crucial. Additionally, the metal facings can be coated or treated for enhanced corrosion resistance and aesthetic appeal, offering both functional and architectural benefits.
