Research Summary

Metal plating and finishing refer to a range of processes used to apply a thin layer of metal onto a substrate surface. This process is applied for various purposes, including improving the appearance, providing corrosion resistance, enhancing durability, improving conductivity, and modifying surface properties. Metal plating involves immersing the substrate into a solution containing metal ions and applying an electric current to deposit the metal onto the surface. Common metals used for plating include gold, silver, nickel, chromium, and copper. Finishing operations such as polishing, buffing, grinding, and coating may follow plating to achieve the desired appearance and surface characteristics. Metal plating and finishing techniques find applications across industries such as automotive, electronics, aerospace, jewelry, and home appliances, where they offer functional and aesthetic enhancements to the finished products. These processes contribute to the longevity, performance, and aesthetic appeal of metal components and products.
