Research Summary

Metal sputtering target is a specialized material used in the process of physical vapor deposition (PVD) or sputtering. It is a solid piece of metal, typically in the form of a disk or plate, that serves as a source for depositing a thin film onto a substrate. During sputtering, a high-energy plasma is generated and bombards the target material, causing atoms or ions to be ejected from the surface. These ejected particles then travel and condense onto a substrate, forming a thin film with the same composition as the target material. Metal sputtering targets are made from pure or alloyed metals, and the choice of material depends on the specific application and desired properties of the thin film. They are widely used in various industries, including electronics, semiconductors, optics, solar cells, and decorative coatings. The quality, purity, and uniformity of the sputtering target material are crucial factors in achieving high-quality thin films with the desired characteristics. Metal sputtering targets are available in different sizes, shapes, and compositions to meet the diverse requirements of different deposition processes and applications.

The major global manufacturers of Metal Sputtering Target include Materion (Heraeus), JX Nippon Mining & Metals Corporation, Praxair, Plansee SE, Hitachi Metals, Honeywell, Mitsui Mining & Smelting, Sumitomo Chemical, ULVAC, TOSOH, Ningbo Jiangfeng, Heesung, Luvata, Fujian Acetron New Materials, Changzhou Sujing Electronic Material, Luoyang Sifon Electronic Materials, GRIKIN Advanced Material, FURAYA Metals, Angstrom Sciences, Advantec, Umicore Thin Film Products, etc. The global players competition landscape in this report is divided into three tiers.
