Research Summary

A metal tube rotameter is a flowmeter that utilizes a tapered metal tube as the primary measurement element. It is designed to measure the flowrate of fluids, typically gases and liquids, in industrial processes. The metal tube is typically made of stainless steel or other corrosion-resistant metals. Inside the tube, a float or rotor is positioned, which moves up and down as the fluid flows through the tube. The position of the float corresponds to the flowrate, allowing for visual or electronic reading of the measured flow. The rotameter's design relies on the principle of differential pressure and fluid mechanics. As the flowrate increases, the pressure drop across the tapered tube increases, causing the float to rise and reach a stable position. The position of the float is typically indicated by a scale or readout, enabling the user to determine the flowrate. Metal tube rotameters are valued for their simplicity, durability, wide range of measurement capabilities, and compatibility with high-pressure and high-temperature applications. They are commonly used in various industries, including chemical processing, oil and gas, water treatment, and pharmaceutical manufacturing, to monitor and control fluid flow.

The major global manufacturers of Metal Tube Rotameter include ABB, Forbes Marshall, Brooks, Yokogawa, Swagelok Company, Parker Hannifin, OMEGA Engineering, TOKYO KEISO, Siemens, Chemtrols, Nixon Flowmeters, etc. The global players competition landscape in this report is divided into three tiers.
