Research Summary

Metallic stearates are compounds derived from the reaction of stearic acid with metal oxides or hydroxides. They are usually in the form of fine powders or waxy substances. Metallic stearates are commonly used as additives in various industries, including plastics, rubber, cosmetics, pharmaceuticals, and food processing. These compounds exhibit a range of properties depending on the specific metal used, with common options including calcium, zinc, magnesium, and aluminum stearates. Metallic stearates offer several beneficial characteristics such as lubrication, stabilizing effects, anti-caking properties, hydrophobicity, and heat stabilization. They are often utilized as release agents, mold release agents, anti-fouling agents, viscosity modifiers, and emulsifiers. Metallic stearates play a significant role in enhancing the performance, processing, and quality of various products in diverse applications.
