### Research Summary

Methanol-to-Gasoline (MTG) is a chemical process that converts methanol, a simple alcohol, into gasoline. This conversion involves catalytic reactions at high temperatures and pressures to rearrange the molecular structure of methanol molecules into hydrocarbons resembling those found in gasoline. The process begins with the dehydration of methanol to produce dimethyl ether (DME), which is then further converted into gasoline-range hydrocarbons through a series of reactions known as the methanol-to-hydrocarbons (MTH) process. MTG technology offers a means to produce gasoline from methanol, derived from sources like natural gas, coal, or biomass, and has potential as a route for producing clean-burning transportation fuels while utilizing abundant and renewable feedstocks. However, MTG processes require significant investment and energy input and face challenges related to catalyst stability, process efficiency, and economics.

The major global manufacturers of Methanol-to-Gasoline include Infinium, Nordic Electrofuel, Topsoe, HIF Global, Hydrogen Optimized, Advanced Biofuel Solutions,

Phycobloom, Solitaire Power, Flemtec, Prometheus Fuels, CAC Synfuel, Carbon Recycling International, Bell Bay Powerfuels, ExxonMobil, etc. The global players competition landscape in this report is divided into three tiers.
