Research Summary

Methoxy polyethylene glycol (MPEG), also known as polyethylene glycol methyl ether, is a polymer that belongs to the class of polyethylene glycols. It is produced by the reaction of ethylene oxide with methanol, resulting in a chain of ethylene glycol units with a methoxy group (-OCH₃) at one end. MPEG is commonly used in various industries and applications due to its unique chemical properties. It is soluble in water and many organic solvents, and it has excellent stability and low toxicity. One of the major applications of MPEG is as a pharmaceutical excipient or drug delivery agent. It is often used as a coating material for drug particles, which helps enhance their stability, bioavailability, and controlled release properties. MPEG can also be utilized in the synthesis of polymers, resins, surfactants, and other chemical compounds. Its versatility, biocompatibility, and ability to modify the properties of substances make it a valuable ingredient in a wide range of industrial and research applications.

The major global manufacturers of Methoxy Polyethylene Glycol (MPEG) include
