Research Summary

Methyl chloride, also known as chloromethane, is a colorless gas with the chemical formula CH_3Cl . It is primarily used as a precursor chemical in the production of silicone polymers, quaternary ammonium compounds, and pharmaceuticals. Methyl chloride is also used as a refrigerant, solvent, and as a blowing agent in foam production. It has been widely used as a methylating agent in chemical synthesis, although its usage has decreased due to environmental concerns regarding its contribution to ozone depletion. Methyl bromide, or bromomethane, is a non-flammable, colorless gas with the chemical formula CH_3Br . It was previously used as a fumigant for soil and stored commodities to control pests. However, its usage has been phased out under the Montreal Protocol due to its ozone-depleting properties and harmful effects on human health. Methyl bromide is still used for critical quarantine and pre-shipment applications, but alternatives are being sought to minimize its environmental impact.

Vinyl chloride is a colorless gas with the formula $\text{CH}_2=\text{CHCl}$. It is an important industrial chemical used primarily in the production of polyvinyl chloride (PVC), a widely used

plastic material. Vinyl chloride is produced through the process of chlorination of ethylene. It is a toxic substance, and prolonged exposure to high levels can have harmful effects on human health, including liver damage and an increased risk of cancer. Strict safety measures are in place to protect workers in industries where vinyl chloride is used, and efforts continue to improve its handling and minimize its impact on the environment and health.
