### Research Summary

Methyl etherified amino resin refers to a class of thermosetting resins that are derived from the condensation reaction of formaldehyde with an amino compound, such as melamine or urea. These resins are modified by introducing methyl groups through etherification, resulting in improved solubility and reactivity. Methyl etherified amino resins are commonly used as crosslinkers or curing agents in coatings, adhesives, and finishes. They offer excellent chemical and abrasion resistance, high film hardness, and good adhesion to various substrates. These resins can be thermally cured to form a durable and highly crosslinked network, providing enhanced durability and performance to the final product. Methyl etherified amino resins are utilized in industries such as automotive, furniture, construction, and electronics, where their properties contribute to the desired characteristics of the coated or bonded materials.

The major global manufacturers of Methyl Etherified Amino Resin include Allnex, Prefere Resins, BASF, Hexion, Melamin d.d. Ko?evje, Chemisol Italia, Galstaff Multiresine, Chang Chun Group, Sanmu Group, etc. The global players competition
