Research Summary

Micro-LED, short for micro light-emitting diode, is an advanced display technology that consists of tiny individual light-emitting diodes (LEDs) that are miniaturized to a microscopic scale. Each micro-LED pixel acts as a self-emitting light source, providing high brightness, color accuracy, and contrast. Compared to traditional LED displays and even OLED displays, micro-LEDs offer several advantages, including improved energy efficiency, longer lifespan, and the ability to achieve a higher pixel density for sharper image quality and pixel-level control. Micro-LED technology is being developed for various applications, including large-scale displays, consumer electronics like televisions and smartphones, augmented reality (AR) and virtual reality (VR) devices, automotive displays, and wearable devices, due to its potential for delivering stunning visuals, enhanced brightness, and superior performance. However, widespread adoption of micro-LED displays is still in the early stages, primarily due to the complex manufacturing process, high costs, and challenges associated with scalability.

The major global manufacturers of Micro-LED include Samsung Electronics, Apple, Sony, Jade Bird Display (JBD), Lumens, LG Display, Innolux Corporation, VueReal,

Plessey Semiconductors, Lumiode, AU Optronics, eLux, etc. The global players competition landscape in this report is divided into three tiers.
